Alex,

Thanks for your email ... I am OK with this repair technique. As you know, the undercut is critical to the integrity of the insert installation.

Regards,
David

David,

I think we have come up with a solution. A dremel was used to regain the "undercut" per QSI006. If the inserts are drilled out, the undercut is restored per QSI 006 and reinstalled with the alignment tabs I would be confident that the original intended structural integrity would be restored. See attached pictures. The pictures show some additional drill holes which was a first attempt to restore the undercut with a drill. The remainder of the repair areas wouldn't have these drill holes. Would this method of repair be acceptable?

Nigel is looking to order the tools to deal with proper installation of the inserts and repair in the future. There are "hogging" tools used for undercutting (rather than the current method of using an allen key in a drill). He is also looking for the proper injection tools for potting the inserts.

David,

Just went to look at the doors again because I really involved in most of the discussions. I gave you some bad info on the phone, it appears to be more extensive:

The majority of the other hole locations still have unground resin (see photo1). So I cannot say whether they are good or not. This is what you're seeing as cracks Alex's photos, the residual resin that wasn't fully ground off because of the unevenness.

There were two other locations that were ground and are uneven. Top-aft hole location (photo2) is similar to what Alex showed in his email. Along the aft edge, there is another location where two inserts look OK but one is recessed (photo3). I would therefore expect problems at the other unground locations as well.

Subject: Med Bell Spacedoor

David,

I was asked to look at a deviation regarding a protruding potted insert on the spacedoor (sliding door) this morning. Please see attached pictures. There are 6 inserts in total that are not level with the adjacent door face. I am concerned with making a call on two inserts shown in the attached pictures. The location is the fwd rollers, which are the only rollers holding the fwd vertical load of the door. This location has both the vertical and horizontal rollers. If this location were to fail, the door will have a tendency to tear away from the aircraft particularly if the door is open in flight.

To install the inserts the foam core is typically undercut to provide an anchor for the insert. In this case to repair the issue would require the insert to be drilled out and re potted. However there would be no "undercut" since the potting compound in there would be like cement and would be unlikely to undercut sufficiently per standard installation procedures. I am unfamiliar with the integrity of bonding Hysol to Hysol. Therefore, I am not confident in this repair method. In this case it would no longer have the safety feature that the undercut normally provides.

Nigel,

I'm not sure if you would be able to look into this but the following is my recommendation for production. I would recommend that potted inserts be installed with "installation tabs" that are used to keep the alignment of the insert through the installation process and while the adhesive is curing. Typically inserts have an associated installation tab. The parts on the drawing are Bell inserts (80-005-2-8) so the installation tab would likely be a Bell part number as well. Trying to align these things without them results in the inserts being uneven with the adjacent surface. See link below for an example of the alignment tools and installation tabs for potted inserts. Might be worth getting some of the appropriate tabs to prevent future issues?
